Overview:
In 2005, the AMA, HRSA and CDC convened an Expert Committee to revise the 1997 childhood obesity recommendations. Representatives from 15 healthcare organizations submitted nominations for the experts who would compose the 3 writing groups (assessment, prevention, treatment). The initial recommendations were released on June 6, 2007 in a document titled “Appendix: Expert Committee Recommendations on the Assessment, Prevention and Treatment of Child and Adolescent Overweight and Obesity – June 6, 2007” [www.ama-assn.org/ama/pub/category/11759.html]. In 2006, the National Initiative for Children’s Healthcare Quality (NICHQ) launched the Childhood Obesity Action Network (COAN). With more than 40 healthcare organizations and 600 health professionals, the network is aimed at rapidly sharing knowledge, successful practices and innovation. This Implementation Guide is the first of a series of products designed for healthcare professionals by COAN to accelerate improvement in the prevention and treatment of childhood obesity.

The Implementation Guide combines key aspects of the Expert Committee Recommendations summary released on 6/6/07 and practice tools identified in 2006 by NICHQ from primary care groups that have successfully developed obesity care strategies (www.NICHQ.org). These tools were developed before the 2007 Expert Recommendations and there may be some inconsistencies such the term “overweight” instead of “obesity” for BMI >=95%ile. The tools are intended as a source of ideas and to facilitate implementation. As tools are updated or new tools developed based on the Expert Recommendations, the Implementation Guide will be updated. The Implementation Guide defines 3 key steps to the implementation of the 2007 Expert Committee Recommendations:

- **Step 1 – Obesity Prevention at Well Care Visits** (Assessment & Prevention)
- **Step 2 – Prevention Plus Visits** (Treatment)
- **Step 3 – Going Beyond Your Practice** (Prevention & Treatment)

### Step 1 – Obesity Prevention at Well Care Visits (Assessment & Prevention)

<table>
<thead>
<tr>
<th>Action Steps</th>
<th>Expert Recommendations</th>
<th>Action Network Tips and Tools</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assess all children for obesity at all well care visits 2-18 years</td>
<td>Physicians and allied health professional should perform, at a minimum, a yearly assessment.</td>
<td>A presentation for your staff and colleagues can help facilitate the implementation of obesity prevention in your practice.</td>
</tr>
</tbody>
</table>
| Use Body Mass Index (BMI) to screen for obesity | ➢ Accurately measure height and weight  
➢ Calculate BMI  
BMI (English) = [weight (lb) ÷ height (in) ÷ height (in)] x 703  
BMI (metric) = [weight (kg) ÷ height (cm) ÷ height (cm)] x 10,000  
➢ Plot BMI on BMI growth chart | BMI is very sensitive to measurement errors, particularly height. Having a standard measurement protocol as well as training can improve accuracy. **BMI calculation** tools are also helpful. Use the **CDC BMI %ile-for-age growth charts**. |
| Make a weight category diagnosis using BMI percentile | ➢ < 5%ile Underweight  
➢ 5-84%ile Healthy Weight  
➢ 85-94%ile Overweight  
➢ 95-98%ile Obesity  
➢ >=99%ile | Until the BMI 99%ile is added to the growth charts, **Table 1** can be used to determine the 99%ile cut-points. Physicians should exercise judgement when choosing how to inform the family. Using more neutral terms such as weight, excess weight, body mass index, BMI, or risk for diabetes and heart disease can reduce the risk of stigmatization or harm to self-esteem. |
| Measure blood pressure | ➢ Use a cuff large enough to cover 80% of the upper arm  
➢ Measure pulse in the standard manner | Diagnose hypertension using **NHLBI tables**. An abbreviated table is shown below (**Table 2**). |
| Take a focused family history | ➢ Obesity  
➢ Type 2 diabetes  
➢ Cardiovascular disease (hypertension, cholesterol)  
➢ Early deaths from heart disease or stroke | A child with one obese parent has a 3 fold increased risk of becoming obese. This risk increases to 13 fold with 2 obese parents. Using a **clinical documentation** tool can be helpful. |
| Take a focused review of systems | Take a focused review of systems | See **Table 3**. Using a **clinical documentation** tool can be helpful. |
| Assess behaviors and attitudes | **Diet Behaviors**  
➢ Sweetened-beverage consumption  
➢ Fruit and vegetable consumption  
➢ Frequency of eating out and family meals | Using **behavioral risk assessment** tools can facilitate history taking and save clinician time. |

| Give consistent evidence-based messages for all children regardless of weight | Limit sugar-sweetened beverages  
|                                              | Eat at least 5 servings of fruits and vegetables  
|                                              | Moderate to vigorous physical activity for at least 60 minutes a day  
|                                              | Limit screen time to no more than 2 hours/day  
|                                              | Remove television from children’s bedrooms  
|                                              | Eat breakfast every day  
|                                              | Limit eating out, especially at fast food  
|                                              | Have regular family meals  
|                                              | Limit portion sizes  
| Use Empathize/Elicit - Provide - Elicit to improve the effectiveness of your counseling | Assess self-efficacy and readiness to change. Use Empathize/Elicit - Provide - Elicit to improve the effectiveness of your counseling.  
|                                              | **Empathize/Elicit**  
|                                              | Reflect  
|                                              | What is your understanding?  
|                                              | What do you want to know?  
|                                              | How ready are you to make a change (1-10 scale)?  
|                                              | **Provide**  
|                                              | Advice or information  
|                                              | Choices or options  
|                                              | **Elicit**  
|                                              | What do you make of that?  
|                                              | Where does that leave you?  
|                                              | A possible dialogue:  
|                                              | **Empathize/Elicit**  
|                                              | “Yours child’s height and weight may put him/her at increased risk for developing diabetes and heart disease at a very early age.”  
|                                              | “Would you be interested in talking more about ways to reduce your child’s risk?”  
|                                              | **Provide**  
|                                              | “Some different ways to reduce your child’s risk are…”  
|                                              | “Do any of these seem like something your family could work on or do you have other ideas?”  
|                                              | **Elicit**  
|                                              | “Where does that leave you?”  
|                                              | “What might you need to be successful?”  
|                                              | **Communication guidelines** can helpful when developing communication skills.  
|                                              | An example from the Maine Collaborative:  
|                                              | 5 fruits and vegetables  
|                                              | 2 hours or less of TV per day  
|                                              | 1 hour or more physical activity  
|                                              | 0 servings of sweetened beverages  
|                                              | Exam and waiting room posters and family education materials can help deliver these messages and facilitate dialogue. Encourage an authoritative parenting style in support of increased physical activity and reduced TV viewing. Discourage a restrictive parenting style regarding child eating. Encourage parents to be good role models and address as a family issue rather than the child’s problem.

### Step 2 – Prevention Plus Visits (Treatment)

<table>
<thead>
<tr>
<th>Action Steps</th>
<th>Expert Recommendations</th>
<th>Action Network Tips and Tools</th>
</tr>
</thead>
</table>
| Develop an office based approach for follow up of overweight and obese children | A staged approach to treatment is recommended for children ages 2-19 years whose BMI is \( \geq 85\% \text{ile} \). In general, treatment begins with Stage 1 (Table 4) and progresses to the next stage if there has been no improvement in weight/BMI or velocity after 3-6 months and the family is willing/ready. The recommended weight loss targets are shown in Table 5. | Prevention Plus visits may include:  
- Health education materials  
- Behavioral risk assessment and self-monitoring tools  
- Action planning and goal setting tools  
- Clinical documentation tools  
- Other health professionals such as dietitians and psychologists  
- Counseling protocols  
Besides behavioral and weight goals, improving self-esteem and self efficacy are important outcomes. Although weight maintenance is a good goal, more commonly, a slower weight gain reflected in a decreased BMI velocity is the outcome seen in lower intensity behavioral interventions such as Prevention Plus. |

**Stage 1 - Prevention Plus**

- Family visits with physician or health professional who has had some training in pediatric weight management/behavioral counseling.
- Can be individual or group visits.
- Frequency - individualized to family needs and risk factors, consider monthly.
- **Behavioral Goals** –
  - Decrease screen time to 2 hr/day or fewer
  - No sugar-sweetened beverages
  - Consume at least 5 servings of fruits and vegetables daily
  - Be physically active 1 hour or more daily
  - Prepare more meals at home as a family (the goal is 5-6 times a week)
  - Limit meals outside the home
  - Eat a healthy breakfast daily
  - Involve the whole family in lifestyle changes
  - More focused attention to lifestyle changes and more frequent follow-up distinguishes Prevention Plus from Prevention Counseling

- **Weight Goal** – weight maintenance or a decrease in BMI velocity. The long term BMI goal is \( < 85\% \text{ile} \) although some children can be healthy with a BMI 85-94\%ile.
- Advance to Stage 2 (Structured Weight Management) if no improvement in weight/BMI or velocity in 3-6 months and family willing/ready to make changes.

**Use motivational interviewing at Prevention Plus visits for ambivalent families and to improve the success of action planning**

- Use patient-centered counseling – motivational interviewing

**Develop a reimbursement strategy for Prevention Plus visits**

- Coding strategies can help with reimbursement for Prevention Plus visits. Advocacy through professional organizations to address reimbursement policies is another strategy.
### Step 3 – Going Beyond Your Practice (Prevention & Treatment)

<table>
<thead>
<tr>
<th>Action Steps</th>
<th>Expert Recommendations</th>
<th>Action Network Tips and Tools</th>
</tr>
</thead>
</table>
| **Advocate for improved access to fresh fruits and vegetables and safe physical activity in your community and schools** | The Expert Committee recommends that physicians, allied healthcare professionals, and professional organizations advocate for:  
- The federal government to increase physical activity at school through intervention programs as early as grade 1 through the end of high school and college, and through creating school environments that support physical activity in general.  
- Supporting efforts to preserve and enhance parks as areas for physical activity, informing local development initiatives regarding the inclusion of walking and bicycle paths, and promoting families’ use of local physical activity options by making information and suggestions about physical activity alternatives available in doctors’ offices. | Physicians and health professionals can play a key role in advocating for policy and built environment changes to support healthy eating and physical activity in communities, child care settings, and schools (including after-school programs). **Advocacy tools and resources** can be help in advocacy efforts. Partnering with others and using evidence-based strategies are also critical to the success of **multi-faceted community interventions.** |
| **Identify and promote community services which encourage healthy eating and physical activity** | Promoting physical activity at school and in child care settings (including after school programs), by asking children and parents about activity in these settings during routine office visits. | Public Health Departments and Parks and Recreation are good place to start looking for community programs and resources. You can work on developing your own partnerships with community organizations (Physical Activity Directory template and/or referral forms). |
| **Identify or develop more intensive weight management interventions for your families who do not respond to Prevention Plus** | The Expert Committee recommends the following staged approach for children between the ages of 2 and 19 years and whose BMI >=85th percentile:  
- **Stage 2 - Structured Weight Management** (Family visits with physician or health professional **specifically trained in weight management**. Visits can be individual or group)  
- **Stage 3 - Comprehensive, Multidisciplinary Intervention** (Multidisciplinary team with experience in childhood obesity. Frequency often weekly for 8-12 weeks with follow up)  
- **Stage 4 - Tertiary Care Intervention** (Medications - sibutramine, orlistat, Very-low-calorie diets, Weight control surgery - gastric bypass or banding). Recommended for select patients only when provided by experienced programs with established clinical or research protocols. Gastric banding is in clinical trials but not currently FDA approved. | Stage 2 could be done without a tertiary care center if community professionals from different disciplines collaborated. For example, if a physician provided the medical assessment, a dietitian provided classes, and the local YMCA provided an exercise program. Partnering with your community tertiary care center can be an effective strategy to develop or link to more intensive weight management interventions (Stages 3 and 4) as well as referral protocols to care for families who do not respond to Prevention Plus Visits. Provider **decision support** tools can be helpful when choosing appropriate treatment and referral options. **Weight management protocols and curriculum** can also be helpful when getting started. |
| **Join the Childhood Obesity Action Network to learn from your colleagues and accelerate progress** | The Childhood Obesity Action Network has launched “The Healthcare Campaign to Stop the Epidemic.” **Join the network** (www.NICHQ.org) to learn from our national obesity experts, share what you have learned and access the tools in this guide. **Together we can make a difference!** |  |
